### The Role of Robots in the Future

Robots have a key part in our society and are evolving every day. Many jobs are becoming controlled by robots. They seem to be able to do everything almost perfectly, and never do anything wrong. There are also some negatives to robots, and there is also a chance that they may harm our future. Robots have become more reliant, being able to do so many things very quickly they seem almost perfect, but they also pose a threat to our future.

Robots have become more reliant in jobs, more specifically in jobs having to do in factories. They can do tasks even faster and more efficient than even we can. There are some problems with robots taking over jobs. This leaves people without jobs and can have financial problems because of that.

Robots also seem to be able to do everything you could ever imagine. Think right now, an example of robots used at home can be smart assistants, like the Amazon Echo Dot and the Google Home Mini. They can do everything you ask it to do, like play the radio, call someone, text someone, set an alarm/timer, etc. We are becoming to be more reliant of robots to do simple tasks we used to do, but now it seems like we really don't have to do them anymore.

Robots also pose a threat to our future. Every day robots are getting even smarter. They are also beginning to take over our jobs, one by one. By the future, there is a possibility that robots could become smart enough to have taken away all our jobs away from us, and

then take over us, what we like to think of as the Human vs. Robot war. There is no problem with the robots evolving, we just need to be cautious of how they are evolving.

Robots are evolving every day and are a key part of our society. They can do whatever we tell them to do, very quickly and efficiently. We do however need to watch the evolution of them, because of one time they could be smart enough to take over humans.
