TUTORIAL 2
BASIC PHOTO CORRECTIONS

In Photoshop, I learned many new things to change photos around from their original form. I first learned how to adjust the color in a photo so I could have it look something different. I then learned how to straighten and crop a photo. Straightening a photo is useful when you have a photo that is not straight, for example diagonal, and you want to make it straight. Cropping is where you take the photo and scale it so that it can fit the area you are working in. From there I went on to changing the color of a hat from pink to green, using the Color Replacement Tool. This allows you to paint another color on top of an already existing color. I then was able to adjust the saturation using the sponge tool. Saturation is the strength/purity of a color or colors. With the Spot Healing Brush tool, I was able to lighten the dark spots on the top left corner of the picture. Applying a content-aware patch allowed me to remove the big crack on the brick wall. The final thing that I did was add a filter, more specifically the Unsharp Mask filter. This adjusts the contrast that creates an illusion of a more focused image. These are the cool new things that I learned through Tutorial 2.
