

## Unit 6 Activity

---

**Username and passwords are stored in an unencrypted database, accessible through the bank's intranet (its internal digital web).**

This is a **BIG** vulnerability, because that means the only two things required to get into an account is available to be stolen. With this information available to be stolen by attackers, they now can get into people's online bank accounts and steal their financial information. Think of this on a large scale, everybody would lose their money and could also lose things as important as their homes.
